Quartz Infrared Detectors
Marcelo Pisani, Ping Kao, Kailiang Ren, Srinivas Tadigadapa

Motivation
- Shear-mode quartz resonators made from certain crystal cuts can be used as very sensitive temperature sensors with unprecedented resolutions of up to $10^{-6}$ °C.

Project Status and Results
- Quartz resonator arrays with excellent resonance characteristics have been fabricated by RIE etching of quartz.
- Temperature sensitivity of 7.2 kHz/K was experimentally measured.
- Infrared calibration tests on the resonator array even without the use of infrared absorbers gave a responsivity of 14.3 MHz/W and an NEP of 326 nW.

Response of 3 quartz resonator pixels upon absorption of infrared radiation from a broad band lamp source modulated at a frequency of 33 mHz.
